

Robustness of the applicability-domain result (70,170 molecules, 15 ChEMBL assays, 10 splits)

A Inside the AD, cliffs fail $\sim 4\times$ more often than non-cliffs — stable across all 8 cuts

AD definition (distance / density type $\times$ quantile cut)

B The label-free dispersion flag keeps the same edge (1.78–1.95x) inside the AD

AD definition (distance / density type $\times$ quantile cut)
